Distance Geometry: Theory, Methods, and Applications Distance geometry is the characterization and study of sets of points based only on given values of the distances between member pairs. More abstractly, it is the study of semimetric spaces and the isometric transformations between them. In this view, it can be considered as a subject within general topology. Historically, the first result in distance geometry is Heron's formula in 1st century AD. The modern theory began in 19th century with work by Arthur Cayley, followed by more extensive deve

Distance Geometry (edited book) - Antonio Mucherino - Web Pages Distance geometry (DG) sets the concept of distance on the basis of Euclidean geometry. The fundamental problem of DG is an inverse problem, i.e. finding a set of points in space whose pairwise distances are equal to some given distances. Among the most important applications we find molecular conformations, localization of sensor networks, and statics.

Distance Geometry Abstract. A general problem in location theory and distance geometry is to find the configuration of p unknown points in IR n satisfying a number of constraints on their mutual distances and their distances to N fixed points, while minimizing a given function of these distances. Global optimization methods recently developed for studying different variants of this problem are reviewed.
