In fact, we can pass, individual members, structure variables, a pointer to structures etc to the function. Similarly, functions can return either an individual member or structures variable or pointer to the structure. Let's start with passing individual member as arguments to a function. Passing Structure Members as arguments to Function

The cell structure is defined by the cell membrane, the cytoplasm, and the nucleus. A cell is the smallest unit of life and its structure helps it to work as the basic building block of biology. The cell function is to keep all of the functions of the body performing as intended. This includes keeping toxins out of the body, help to break down waste, make nutrients and act as barriers within organelles.

Structure: The small intestine has three sub-regions: Duodenum: C- shaped. Jejunum: A long coiled middle portion. Ileum: Highly coiled. It opens in the large intestine. The walls of the small intestine have finger-like foldings called villi. The cells which line the villi produce many small projections called microvilli.

A single protein molecule may contain one or more of these protein structure levels and the structure and intricacy of a protein determine its function. Collagen, for example, has a super-coiled helical shape that is long, stringy, strong, and rope-like/collagen is great for providing support.

The Structure and Function of Proteins

Formation of Cilia and Flagella (to provide the cell with the ability to sense extracellular signals and also helps in movement): Occurs by a process known as ciliogenesis. centrioles give rise to basal bodies, with both having an identical size, structure, and chemical compositions. Basal bodies later develop into cilia and flagella.
