Summary ; We develop a Markov-switching GARCH model (MS-GARCH) wherein the conditional mean and variance switch in time from one GARCH process to another. The switching is governed by a hidden Markov chain. We provide sufficient conditions for geometric ergodicity and existence of moments of the process. Because of path dependence,

Theory and inference for a Markov switching GARCH model

A Markov-switching model is a nonlinear specification in which different states of the world affect the evolution of a time series. The dynamic properties depend on the present regime, with the regimes being realizations of a hidden Markov chain with a finite state space.

In this paper we develop a unifying Markov-switching GARCH model which enables us (1) to specify complex GARCH equations in two distinct Markov-regimes, and (2) to model GARCH equations of different functional forms across the two Markov-

The initial studies of Markov-switching autoregressive heteroscedastic models applied to financial time series focused on specifications, and thus omitted a lagged value of the conditional variance in the variance equation Cai (1994), Hamilton and Susmel (1994).

is proposed to overcome the path dependence problem. According to Gray's model, once the conditional volatility processes are differentiated between regimes, an aggregation of the conditional variances for the regimes could be used to construct a single variance coefficient to evaluate the path dependence.

LECTURE ON THE MARKOV SWITCHING MODEL

In financial econometrics, the Markov-switching multifractal (MSM) is a model of asset returns developed by Laurent E. Calvet and Adlai J. Fisher that incorporates stochastic volatility components of heterogeneous durations. MSM captures the outliers, log-memory-like volatility persistence and power

Accordingly, we employ two variants of a Markov regime-switching GARCH model, one with normally distributed errors (MS-GARCH-N) and another with t-distributed errors (MS-GARCH-t), and compare their relative in-sample as well as out-of-sample performances with those of their standard

The MS-ARMA-GARCH model with regime switching in the conditional mean and variance are defined as a regime switching model where the regime switches are governed by an unobserved Markov chain in the conditional mean and in the conditional variance processes as where, Thus, the parameters have nonnegativity constraints and the regimes are determined by , and the probability is calculated through iteration:
