Linear algebra has two aspects. Abstractly, it is the study of vector spaces over fields, and their linear maps and bilinear forms. Concretely, it is matrix theory: matrices occur in all parts of mathematics and its applications, and everyone work-ing in the mathematical sciences and related areas needs to be able to diagonalise

1 Vector spaces IB Linear Algebra (iii) $(+)v = v+ v$ for all ; $2F, v \in 2V$ (distributivity in F) $(iv)1v = v$ for all $v \in 2V$ (identity) We always write 0 for the additive identity in V , and call this the identity. By abuse of notation, we also write 0 for the trivial vector space $\{0\}$.

Part IB - Linear Algebra

Linear algebra is the study of the algebraic properties of linear transformations (and matrices). Algebra is concerned with how to manipulate symbolic combinations of objects, and how to equate one such combination with another; e.g. how to simplify an expression such as $(x + 3)(x + 5)$. In linear algebra we shall manipulate not just scalars,

Write S for the span of S , the set of all linear combinations of elements of S . Notice that it is important in the definition to use only finitely many elements – infinite sums do not make sense in arbitrary vector spaces. We will see later why it is convenient notation to say that 0 is a linear combination of $n = 0$ elements of S .

Linear Algebra - University of Cambridge

Linear Algebra (in addition to Calculus/Analysis) is the most important part of any university Mathematics course. This is a rigorous first module in linear algebra. The ideas introduced in Vectors & Matrices for two- and three-dimensional space will be developed and extended in a more general setting with a view to applications in subsequent pure and applied mathematics, probability and statistics modules.

Much of the machinery of linear algebra involves matrices, which are rectangular arrays of numbers. A rectangular array of numbers, enclosed in a large pair of either parentheses or brackets, such as is called a matrix. The size or dimensions of a matrix are specified by stating the number of rows and the number of columns it contains.

Linear transformation: every linear transformation leads to a matrix. Mapping: $Sx \mapsto T(x)$ where Sx is a vector. The two rules of linear transformation: $T(v+w) = T(v) + T(w)$ $T(cv) = cT(v)$ If the matrix A is the matrix of some linear transformation T , then $T(x) = Ax$.
