Phase diagrams are usually introduced into the engineering curriculum during the study of physical chemistry, prior to specialization into ceramic engineering. This creates an artificial separation between consideration of the equilibrium description of the chemically heterogeneous system and the engineering and physical processes required for phase, microstructure, and property development in ceramic materials.

Phase Diagrams in Advanced Ceramics reviews some of the recent advances in the understanding of these composite systems, providing insight into how phase diagrams can be utilized in the fabrication of whiskers and ceramic-matrix whisker-reinforced ceramics. Phase relations and sintering information is reviewed for transparent polycrystalline oxides.

The original compilation of phase diagrams was made by F. P. Hall and Herbert Insley and was published as the October, 1933, issue of The Journal of The American Ceramic Society. These authors then followed with a supplement, published as the April, 1938, issue of the same Journal, and with another complete compilation which was published as Part II of the November, 1947, issue of this Journal.

The partial vitrification process can be analyzed through a phase diagram such as that shown in Traditional ceramics - Traditional ceramics - Vitrification: The ultimate purpose of firing is to achieve some measure of bonding of the particles (for strength) and consolidation or reduction in porosity (e.g., for impermeability to fluids).

Published from 1964 to 1992 as the reference-series Phase Diagrams for Ceramists ("Blue Books"), SRD 31 is the result of a long-standing collaboration between NIST and The American Ceramic Society to develop and maintain a state-of-the-art database of evaluated phase equilibria data for industrial and academic customers. NIST (then NBS) staff played key roles in establishing the project as a data-driven extension of existing core expertise in phase equilibrium science, thermodynamics ...

Phase Diagrams As previously stated, the phase diagram is simply a map showing the structure of phases present as the temperature and overall composition of the alloy are varied. It is a very useful tool for understanding and controlling the structures of polyphase materials.
