There are many superb books on how to do operations but there are few or none on how to assist at them, and none written either by or for medical students or doctors. Therefore, the skills that make an expert surgical assistant are difficult to acquire. Normally, they can only be learnt in a haphazard way, by spending years in the operating theatre. This book describes those skills in a concise and systematic way, in surgery in general, and in ten different speciality areas. Although intended mainly for clinical-level medical students and junior doctors, other people who assist at surgical operations, including general practitioners, nurse assistants and surgical technologists, will also find it useful. Whether planning a career in surgery, or simply aiming for high marks in a surgical rotation, there are few better ways to impress a surgeon than by skillfully assisting at surgical operations.

Surgeons have a duty to provide accurate information before asking for consent for surgery, and patients are increasingly interested in obtaining as much information as possible regarding their procedures. Consent in Surgery addresses these vital areas, outlining the consent process for common surgical procedures, including indications, benefits, risks/complications, alternative treatment options, a brief description of each procedure and summaries of the relevant scientific evidence. It contains procedures from subspecialties including cardiothoracic surgery, neurosurgery, general surgery, paediatric surgery, plastic and reconstructive surgery, trauma and orthopaedic surgery, otolaryngology and urology. The procedures included fall within the Intercollegiate Surgical Curriculum Project and MRCS syllabi, and are assessed during higher specialist training, making the book an essential revision and interview preparation tool.
