A rectifier is

an electrical device that converts alternating current (AC), which periodically reverses direction, to direct current (DC), which flows in only one direction. The reverse

operation is performed by the inverter. The process is known as rectification, since it "straightens" the direction of current.

A modern motorcycle rectifying regulator is a complex device constructed of a series of semiconductors mounted on a printed circuit board and packed in a compact housing. It

controls every aspect of charging and power supply systems, so it must be very powerful to support plenty of electrical devices found in today's motorcycle.
