The Reentry Simulation simulates the struggles and challenges faced by individuals who are transitioning from incarceration back into society. The goal of this simulation is for participants to gain an understanding of the significant obstacles faced by men and women attempting to navigate the system upon their release from incarceration and returning home to their communities.

A new reentry simulation tool, GESARED, was implemented in the MATLAB®/SIMULINK environment. The primary objective of this simulator is to be used as a design environment of GN&C systems for reentry vehicles. As a testbed, GESARED is also designed to facilitate performance evaluations against requirements in both nominal and off-nominal conditions, allowing the entire GN&C system development process to be condensed in one tool based on a compatible, versatile, and easy-to-use environment.

Sensitivity analysis helps find the optimal levels for inputs (eg., raw material prices, number of employees, sales price). Sensitivity analysis is a statistical tool based on seeing how inputs and parameters affect outputs. Generally, each input is changed one at a time to see how it affects output.

Simulation-based education is a learner-centered approach, grounded in learning theories based on constructivism. As such, learners create their own reality and truth. To support this type of learning, activities include discussion, self-reflection, and questioning so that learners can engage actively in the learning process ( Kriz, 2010 ).

Simulation-based optimization (also known as simply simulation optimization) integrates optimization techniques into simulation modeling and analysis. Because of the complexity of the simulation, the objective function may become difficult and expensive to evaluate. Usually, the underlying simulation model is stochastic, so that that the objective function must be estimated using statistical ...
